National Testing Laboratory for Solid-State Hydrogen Storage Technologies
San Antonio, TX

DOE Annual Merit Review, Washington DC
May 9-13, 2011

Overview

Timeline

Phase I

- ❖ Program Start: March 2002
- ❖ Program End: September 2006
- ❖ 100% Complete

Phase II

- ❖ Program Start: October 2006
- ❖ Program End: March 2012
- ❖ 85% Complete

Barriers

- ❖ Standardization of Methods
- ❖ "Gold Standard" Measurements
- ❖ Verification of Material Performance
 - (P) Understanding of Physisorption & Chemisorption Processes
 - (Q) Reproducibility of Performance
- ❖ Verification of System Performance
 - (Q) Reproducibility of Performance
 - (K) System Life-Cycle Assessment
- ❖ Codes & Standards (F)

Budget

Phase I

- ❖ DOE Share: \$2.386M
- ❖ SwRI Share: \$0.62M

Phase II

- ❖ DOE Share: \$2.0M
- ❖ Funding Received in FY10: \$216k
- ❖ Funding Planned in FY11: \$200k

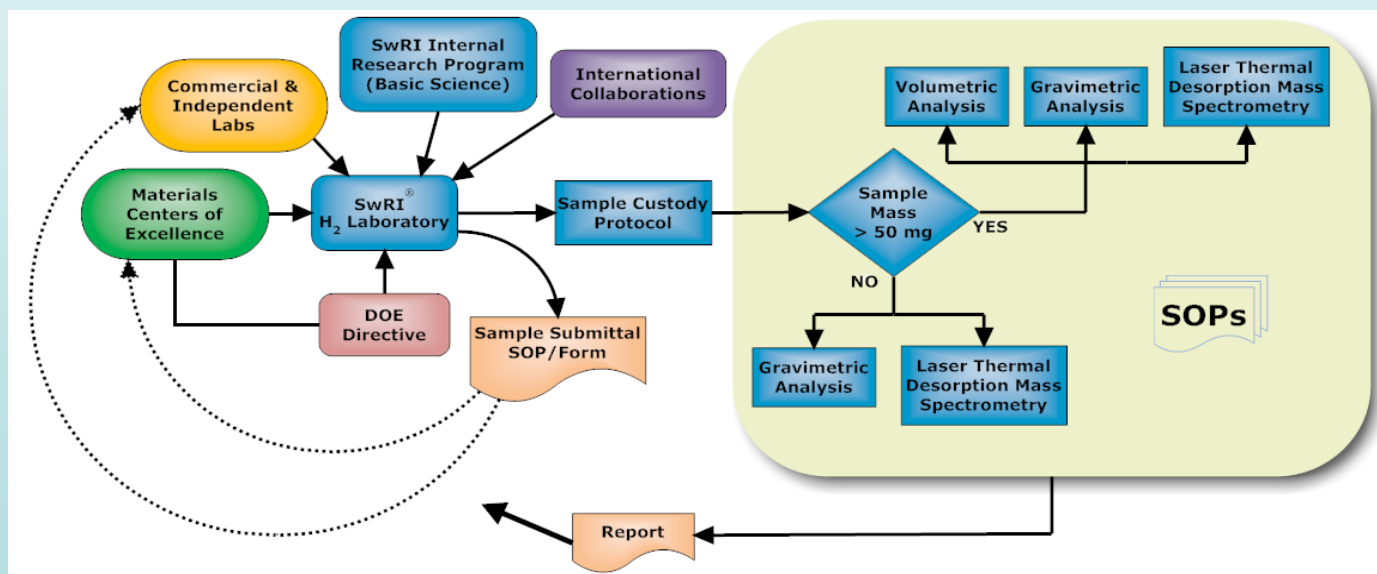

Partners / Collaborations

- ❖ INER (Taiwan)
- ❖ NESSHY (EC-JRC)
- ❖ Washington State University
- ❖ U. Idaho
- ❖ GoNano Technologies, Inc.

Objectives - Relevance

Overall

- ❖ Support DOE's Hydrogen Storage Program by operating an independent national-level laboratory aimed at assessing and validating the performance of novel and emerging solid-state hydrogen storage materials and full-scale systems
- ❖ Conduct measurements using established protocols to derive performance metrics: capacity, kinetics, thermodynamics, and cycle life
- ❖ Support parallel efforts underway within the international community, in Europe and Japan, to assess and validate the performance of related solid-state materials for hydrogen storage
- ❖ Validate the technologies required to achieve the 2015 DOE on-board vehicle hydrogen storage goals
- ❖ Continue new hydrogen storage materials discovery R&D for advanced storage systems

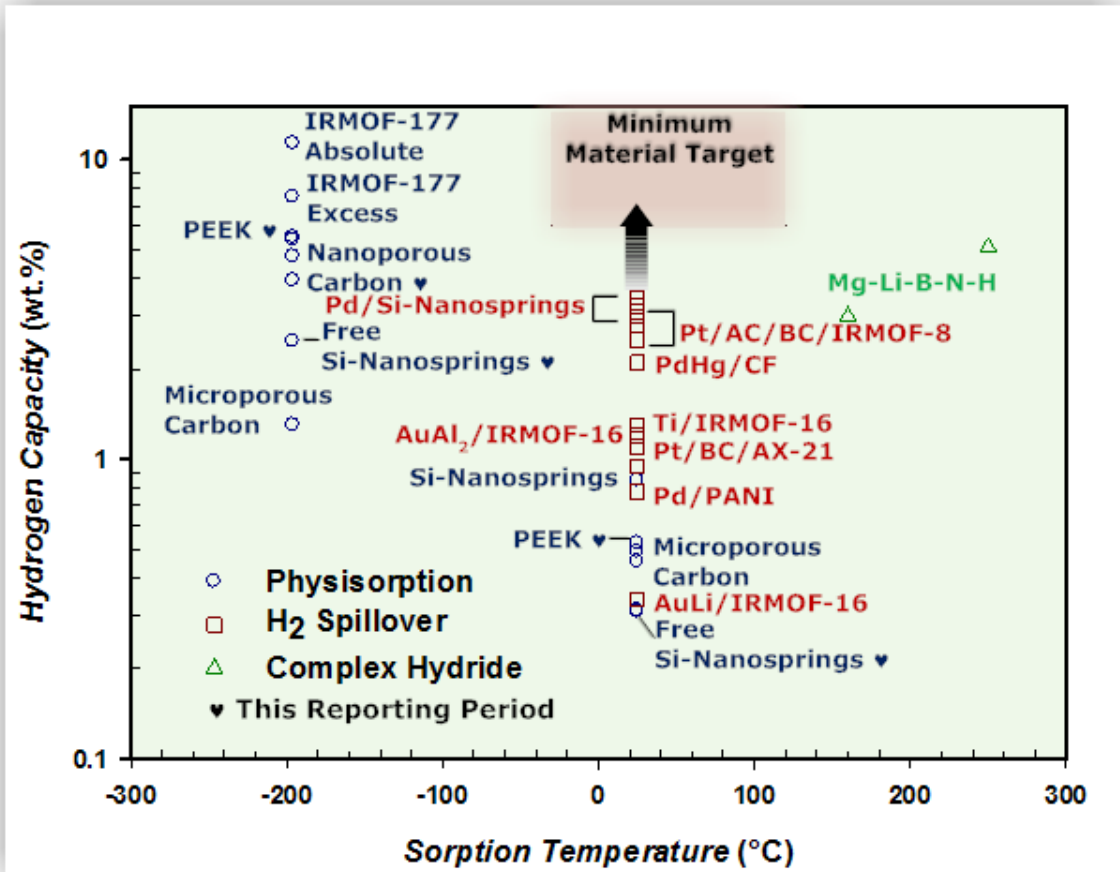

Objectives - Relevance

Status of Material Technologies for Reversible Hydrogen Storage via Physisorption, Spillover, and Chemisorption – In Proximity to DOE Target

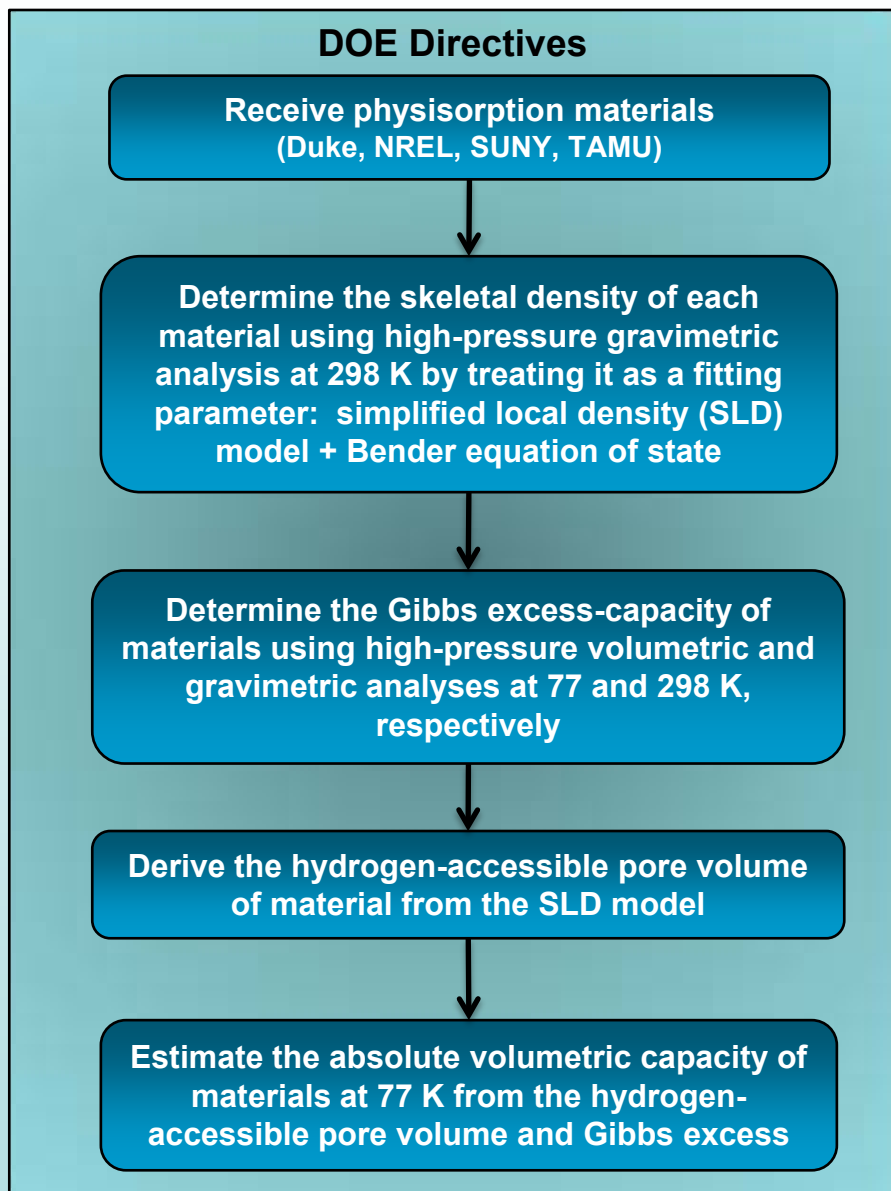

Current

Analyze hydrogen sorption properties at 77 and 298 K of:

- CO₂-activated PEEK-derived carbon (material provided by Duke Univ.)
- PEEK-derived carbon (material provided by SUNY)
- Microporous carbon (material provided by NREL)
- Glass nanosprings (material provided by GoNano™)
- Porous Polymer Network (PPN) ⇒ analysis underway (material provided by TAMU)

Approach

ACCOMPLISHMENTS IN RESPONSE TO DOE PRIORITIES & DIRECTIVES

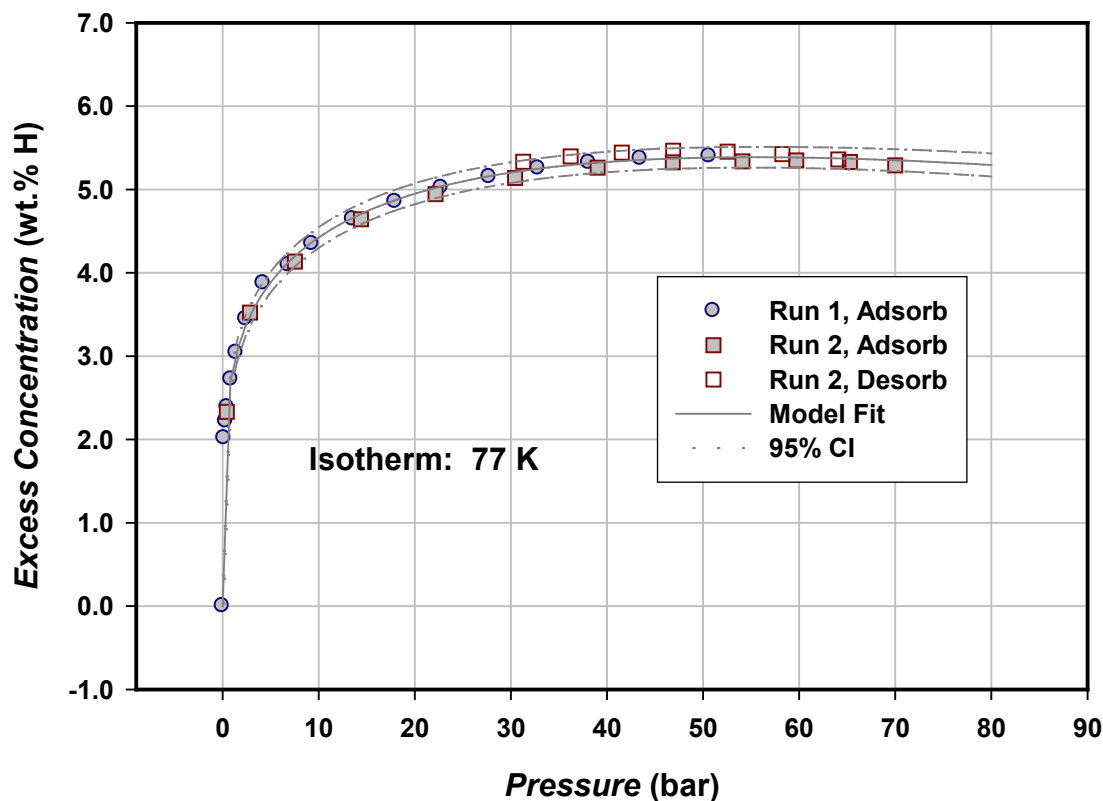

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in CO₂-Activated PEEK-Derived Carbon (Material Provided by Duke Univ.)

- ❖ Isotherm curves were corrected for the free volume of the sample (or skeletal density), as determined by gravimetric analysis
- ❖ Kinetics are relatively fast, reaching steady-state conditions within ~ 20 min
- ❖ Peak uptake of **5.39 wt.% at 55 bar**
- ❖ No evidence of hysteresis
- ❖ Further verification and accuracy check of skeletal volume (and density) was done at 298 K via gravimetric analysis
- ❖ Pore volume derived from gravimetric analysis was used to estimate volumetric capacity

Corrected Hydrogen Isotherms at 77 K (Volumetric Analysis)

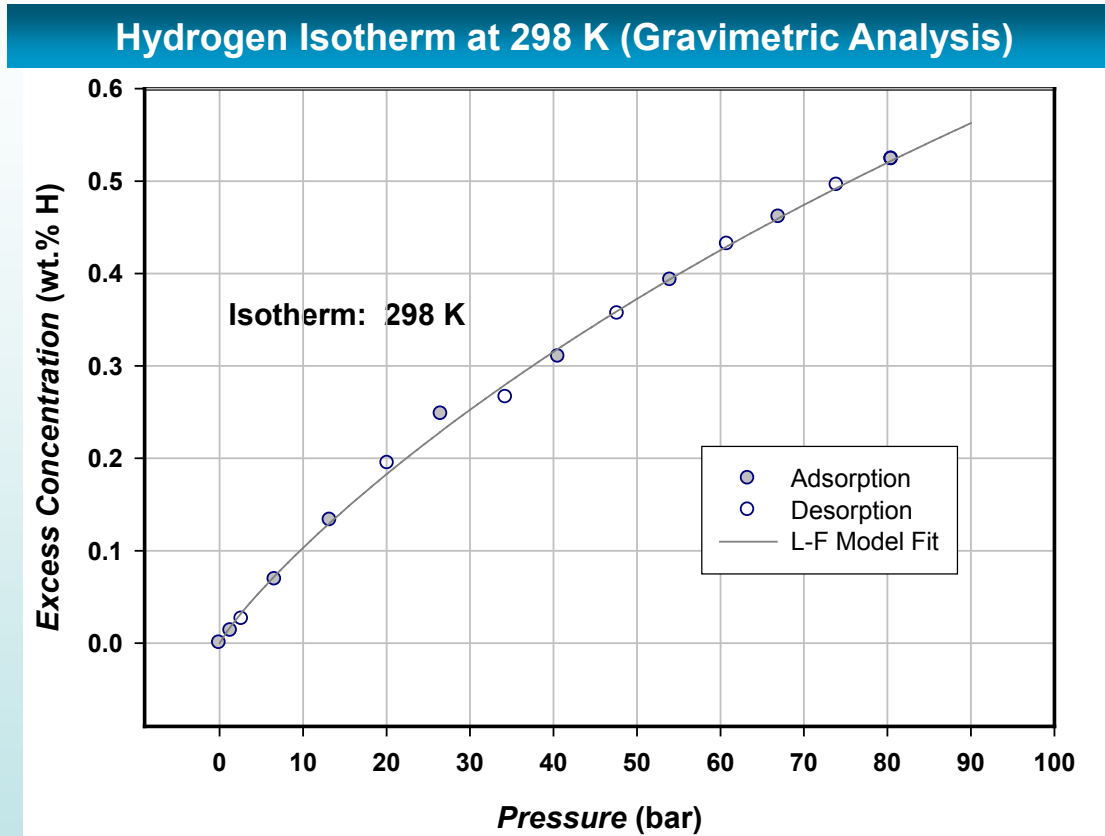

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in CO₂-Activated PEEK-Derived Carbon (Material Provided by Duke Univ.)

- ❖ Isotherm at 298 K (gravimetric technique) was used to cross-check skeletal density and to semi-empirically predict pore volume
- ❖ Peak uptake of **0.52 wt.% at 80 bar**
- ❖ Simplified Local Density (SLD) model combined with Bender Equation of State (BEOS) were employed to estimate pore volume

H₂-Derived Skeletal Density (g/cc)
3.92

SLD Model for Gravimetric Gibbs Excess

$$W_a - W_{sb} \left(1 - \frac{\rho_g}{\rho_{sb}} \right) - W_s \left(1 - \frac{\rho_g}{\rho_s} \right) = V_{ad} (\rho_{ad} - \rho_g) \equiv \Gamma$$

Gibbs Excess

- W_a = Apparent weight
- W_{sb} = Weight of sample basket
- W_s = Sample weight
- ρ_g = Bulk-gas density
- V_{ad} = Volume of adsorbed layer

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in CO₂-Activated PEEK-Derived Carbon (Material Provided by Duke Univ.)

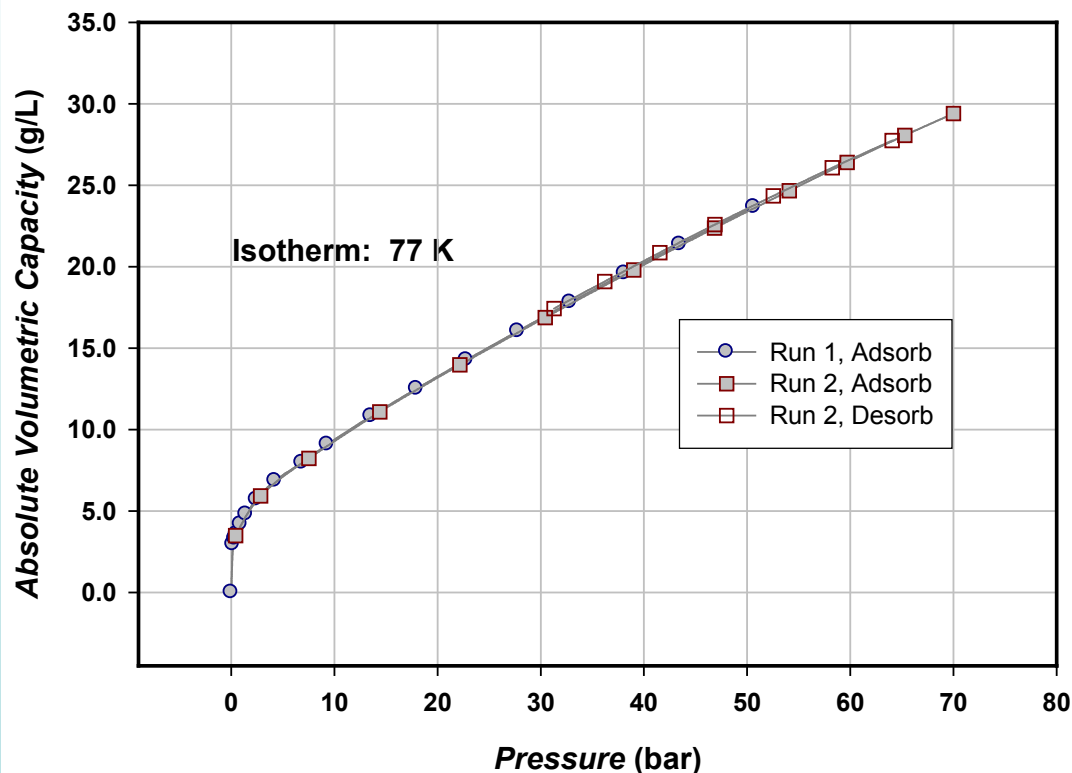

- ❖ Absolute volumetric capacity at 77 K approaches **30 g/L at 70 bar**
- ❖ Absolute capacity estimated by:

$$n_{abs} = n_{ex} + \rho_{bulk} V_{pore}$$

- ❖ n_{abs} not directly accessible by experiment (semi-empirically determined from gravimetric measurement and SLD model)
- ❖ ρ_{bulk} determined from BEOS

H ₂ -Derived Specific Pore Volume (cc/g)	Total Pore Volume (cc)
6.62	13.16

Absolute Volumetric Capacity at 77 K (Volumetric Analysis)

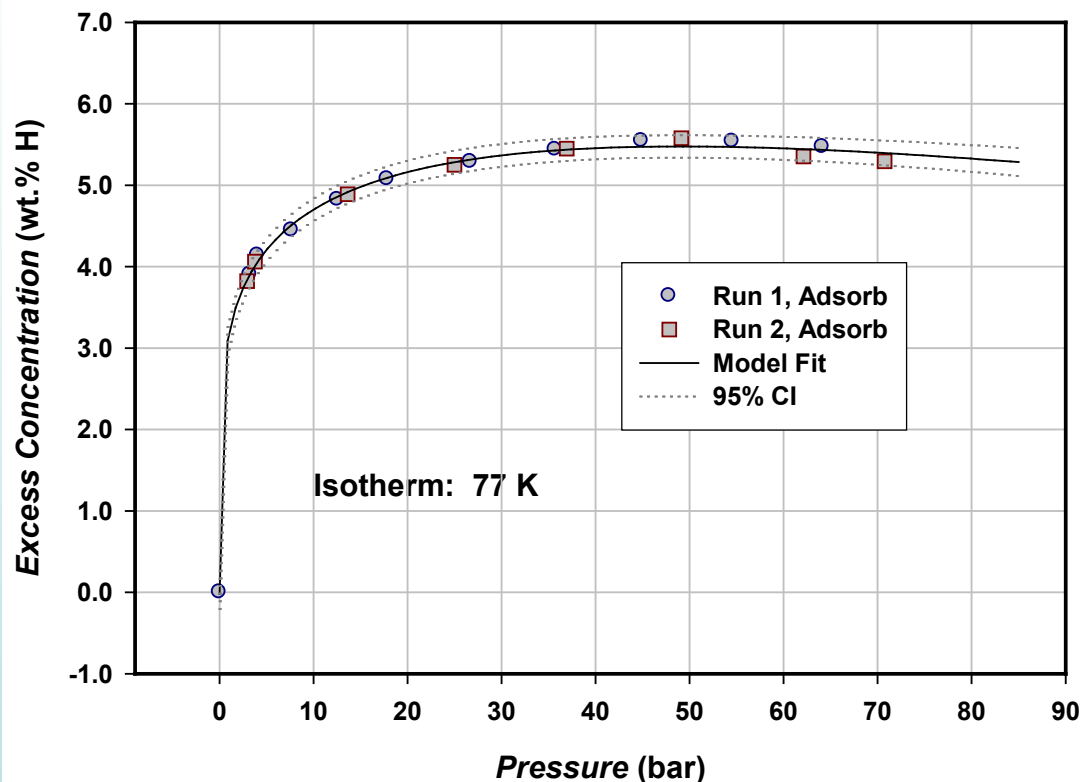

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in PEEK-Derived Carbon (Material Provided by SUNY)

- ❖ Helium has measurable uptake in this material, leading to erroneous measurement of the skeletal density
- ❖ Hydrogen isotherms measured at 298 K via the gravimetric technique and SLD model were used to accurately determine skeletal density
- ❖ Isotherm curves at 77 K were corrected for the free volume of the sample (or skeletal density), as determined by gravimetric analysis
- ❖ Peak uptake of **5.50 wt.%** at **49 bar**

Corrected Hydrogen Isotherms at 77 K (Volumetric Analysis)

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in PEEK-Derived Carbon (Material Provided by SUNY)

- ❖ Absolute volumetric capacity at 77 K approaches **38.2 g/L at 71 bar**
- ❖ Pore volume derived from gravimetric analysis and SLD model was used to estimate volumetric capacity

Absolute Volumetric Capacity at 77 K (Volumetric Analysis)

H ₂ -Derived Skeletal Density (g/cc)	H ₂ -Derived Specific Pore Volume (cc/g)	Total Pore Volume (cc)
3.70	2.69	2.32

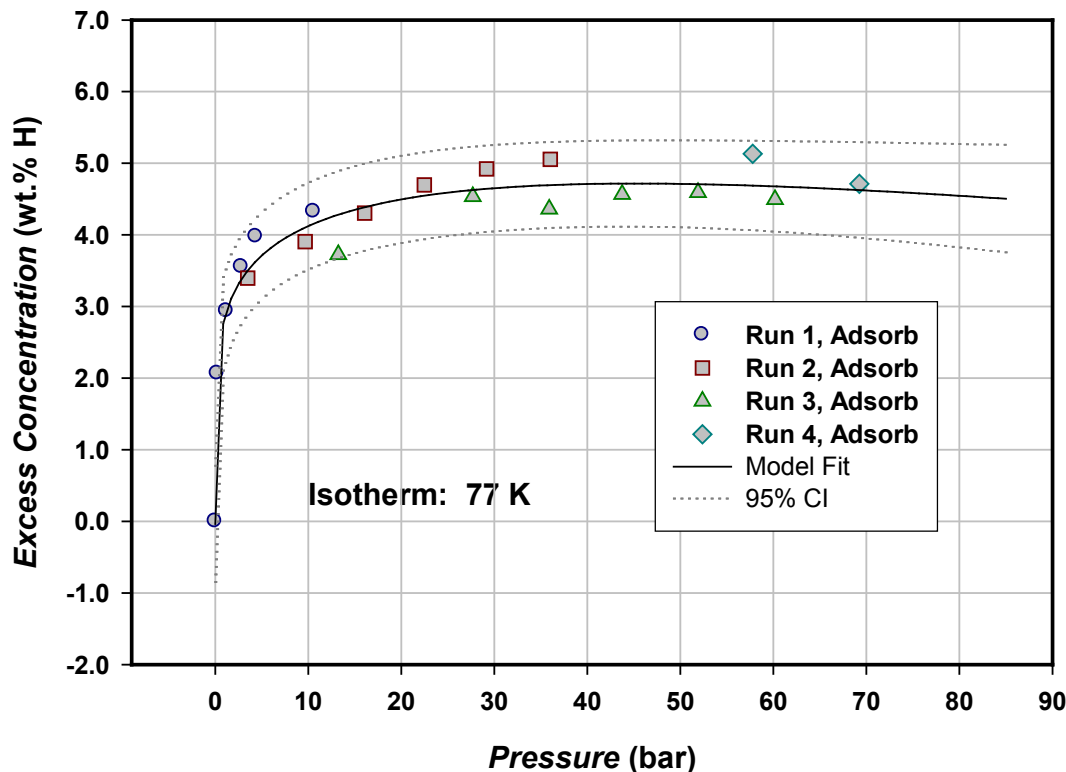

Accomplishments – DOE Directives

Evaluate/Validate Hydrogen Sorption in Microporous Carbon (Material Provided by NREL)

- ❖ Four analysis runs were required to build a complete isotherm curve due to slow kinetics (*i.e.*, long equilibration times)
- ❖ Material was thermally conditioned *in vacuo* after each adsorption cycle
- ❖ Peak uptake of **4.75 wt.%** at **45 bar**
- ❖ Larger than normal scatter in isotherm curve is due to thermal conditioning between analysis runs

Absolute Volumetric Capacity at 77 K (Volumetric Analysis)

Accomplishments – DOE Directives

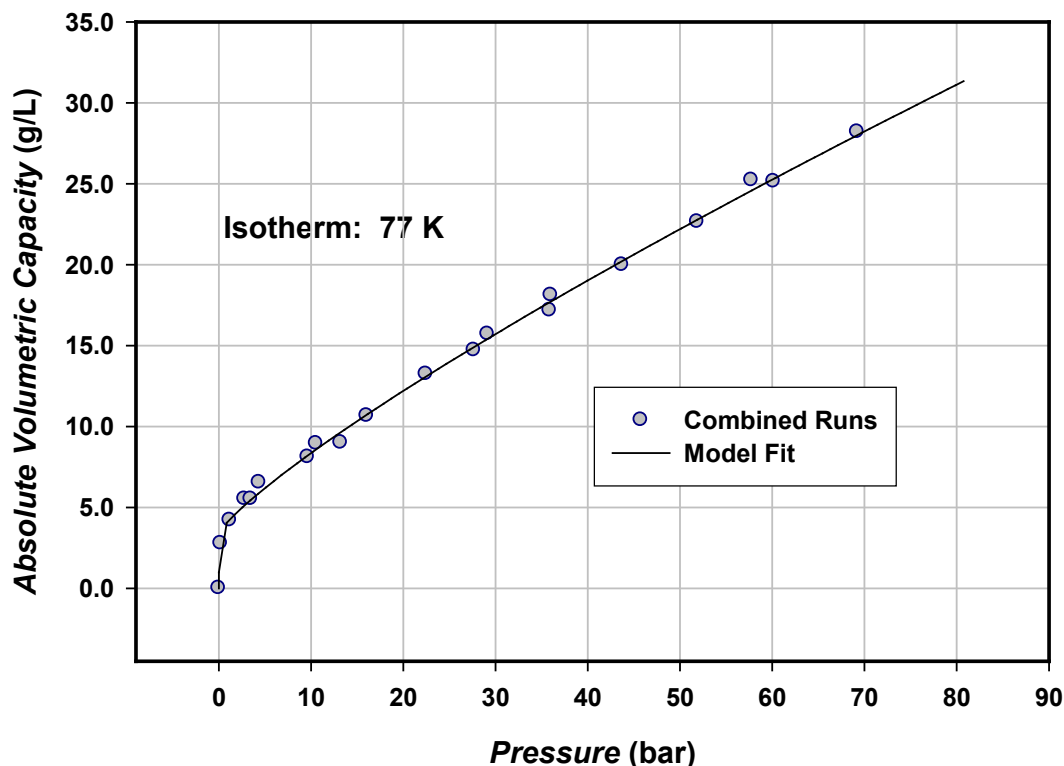

Evaluate/Validate Hydrogen Sorption in Microporous Carbon (Material Provided by NREL)

- ❖ Absolute volumetric capacity at 77 K approaches **28.2 g/L at 70 bar**
- ❖ Pore volume derived from gravimetric analysis and SLD model was used to estimate volumetric capacity

H ₂ -Derived Skeletal Density (g/cc)	Total Pore Volume (cc)
4.90	1.74

Corrected Hydrogen Isotherms at 77 K (Volumetric Analysis)

ACCOMPLISHMENTS RELATED TO SWRI'S INTERNAL & EXTERNAL RESEARCH COLLABORATIONS

Accomplishments – External Collaboration

Hydrogen Uptake in Free Silica Nanosprings

Motivation: Silica nanosprings consist of braided nanowires, forming continuous nano-scale troughs between wires that serve as interstitial sites for physisorption. This work is aimed at gaining a better understanding of the hydrogen sorption behavior of these novel materials by circumventing the analytical challenges previously encountered with measuring hydrogen sorption in Al-supported nanosprings.

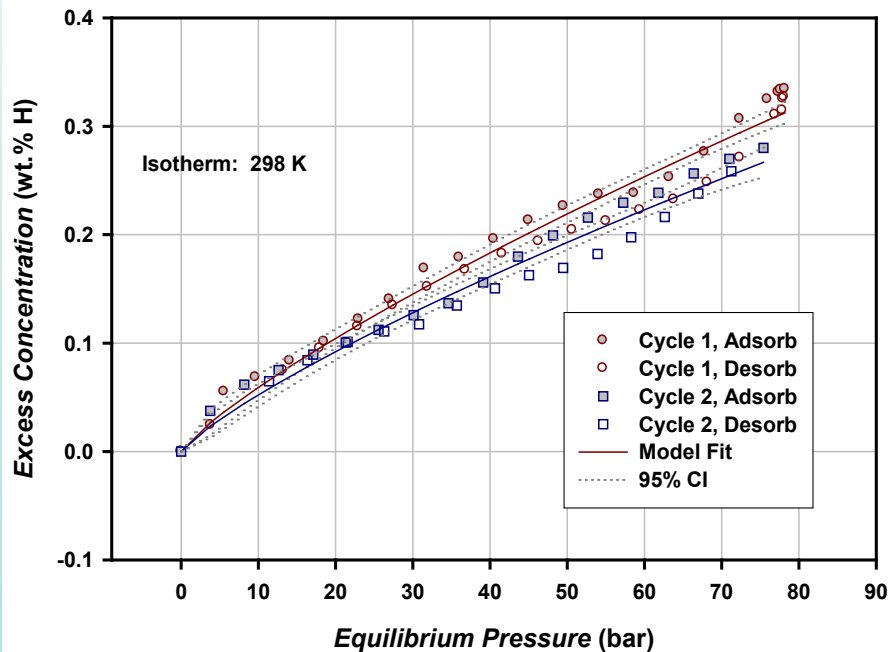

Free, unbound nanosprings require careful analytical practices and material handling in order to accurately measure hydrogen sorption, due to their low bulk density and propensity to fluidize at elevated gas pressures.

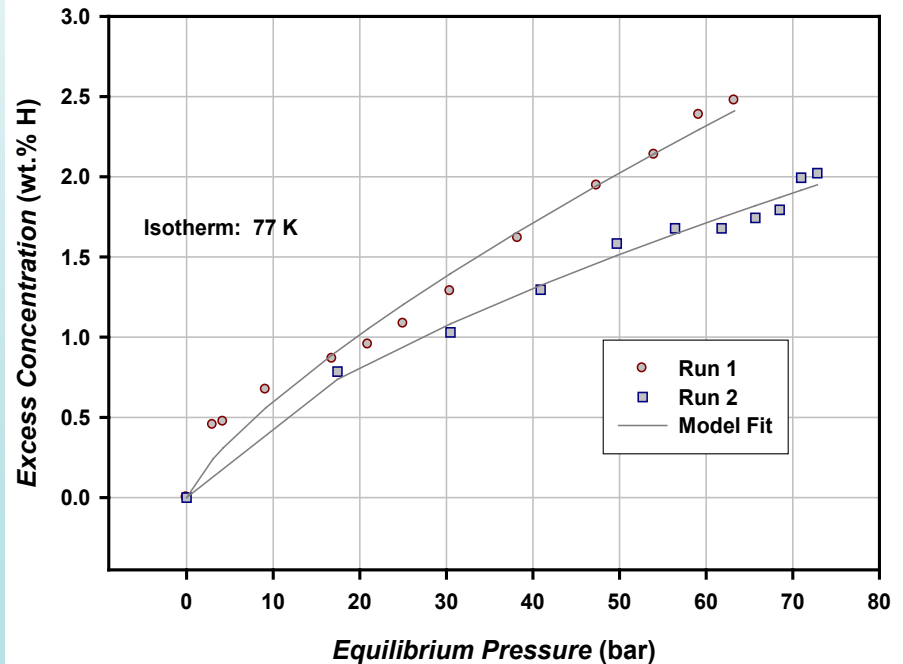

Hydrogen Uptake in Free Silica Nanosprings

- ❖ Preparation of free, unbound nanosprings (*i.e.*, not anchored to Al substrate) permits more accurate analysis of hydrogen uptake than has been previously possible with their Al-supported counterparts
- ❖ Peak uptake ranges **0.27 – 0.31 wt.% at 298 K and 75 bar**, and **1.75 – 2.47 wt.% at 77 K and 63 bar**
- ❖ Adsorption profiles exhibit measureable irreversibility following additional cycles or complete runs with thermal reconditioning, which is consistent with previous measurements for Al-supported nanosprings
- ❖ Maximum Gibbs excess not observed at 77 K up to 75 bar

Hydrogen Isotherm at 298 K (Volumetric Analysis)

Hydrogen Isotherm at 77 K (Volumetric Analysis)

Future Work (FY11)
